BKCAS: A DISTRIBUTED CONTEXT-AWARE PERVASIVE INFORMATION SYSTEM TO SUPPORT USER ROAMING

Nguyen Chan Hung, Vu Thanh Vinh, Nguyen Huu Thang, Khuong Duy, Nguyen Tuan Dung, Nguyen Manh Thang

TÓM TẮT:

Until, recently, the wide deployment of pervasive information system is still limited due to high cost of infrastructure, and more important, its requirement of rebuilding a new information infrastructure from scratch without reusing much from the current working system. In this study, we propose Bkhoa context-aware system (BKCAS), a novel architecture for scalable pervasive information system having the capability of intelligently routing multimedia messages to users based on the context processing. Moreover, BKCAS support user roaming over a large number of loosely coupled autonomous domains. Differ from many other pervasive systems, which assume a completely newly built infrastructure, our approach focuses on Until, recently, the wide deployment of pervasive information system is still limited due to high cost of infrastructure, and more important, its requirement of rebuilding a new information infrastructure from scratch without reusing much from the current working system.
